

## BIOMEDICAL IMAGE ANALYSIS IN PYTHON

# Intensity Values

Stephen Bailey  
Instructor

# Pixels and voxels

- **Pixels** are 2D picture elements
- **Voxels** are 3D volume elements
- Two properties: intensity and location

# Data types and image size

Array's data type controls range of possible intensities

Data Type	Range	No. Values
<b>uint8</b>	<b>0, 255</b>	<b>256</b>
int8	-128, 127	256
uint16	0, $2^{16}$	$2^{16}$
int16	$-2^{15}$ , $2^{15}$	$2^{16}$
float16	$\sim -2^{16}$ , $\sim 2^{16}$	$\gg 2^{16}$

```
import imageio
im=imageio.imread('foot-xray.jpg')
im.dtype
dtype('uint8')
im.size
153600
im_int64 = im.astype(np.uint64)
im_int64.size
1228800
```

# Histograms

- **Histograms:** count number of pixels at each intensity value.
- Implemented in `scipy.ndimage`
  - higher-dimensional arrays
  - masked data
- Advanced techniques and functionality in `scikit-image`.

```
import scipy.ndimage as ndi

hist = ndi.histogram(im, min=0,
                    max=255,
                    bins=256)

hist.shape
(256, )

plt.plot(hist)
plt.show()
```

# Equalization

- Distributions often skewed toward low intensities (background values).
- **Equalization**: redistribute values to optimize full intensity range.
- **Cumulative distribution function**: (CDF) shows proportion of pixels in range.

# Equalization

```
import scipy.ndimage as ndi

hist = ndi.histogram(im, min=0,
                    max=255,
                    bins=256)

cdf = hist.cumsum() / hist.sum()
cdf.shape
(256,)

im_equalized = cdf[im] * 255

fig, axes = plt.subplots(2, 1)
axes[0].imshow(im)
axes[1].imshow(im_equalized)
plt.show()
```

## BIOMEDICAL IMAGE ANALYSIS IN PYTHON

**Let's practice!**

## BIOMEDICAL IMAGE ANALYSIS IN PYTHON

# Masks

Stephen Bailey  
Instructor

# Masks

Raw image

Image mask

# Creating masks

Logical operations result in True / False at each pixel

```
mat = np.array([[1, 2, 3],
                [4, 5, 6],
                [7, 8, 9]])

mat > 5
np.array([[False, False, False],
          [False, False, True ],
          [True,  True,  True ]])
```

## Sample Operations

Operation	Example
Greater	<code>im &gt; 0</code>
Equal to	<code>im == 1</code>
X and Y	<code>(im &gt; 0) &amp; (im &lt; 5)</code>
X or Y	<code>(im &gt; 10)   (im &lt; 5)</code>

# Creating masks

```
hist=ndi.histogram(im, 0, 255, 256)
```

```
mask1 = im > 32
```

# Creating masks

```
mask2 = im > 64
```

```
mask3 = mask1 & ~mask2
```

# Applying masks

**np.where(condition, x, y):** control what data passes through the mask.

```
import numpy as np  
  
im_bone = np.where(im > 64, im, 0)  
  
plt.imshow(im_bone, cmap='gray')  
plt.axis('off')  
plt.show()
```

# Tuning masks

```
m = np.where(im > 64, 1, 0)
```

```
ndi.binary_dilation(m, iterations=5)
```

# Tuning masks

```
ndi.binary_erosion(m, iterations=5)
```

## BIOMEDICAL IMAGE ANALYSIS IN PYTHON

**Let's practice!**

## BIOMEDICAL IMAGE ANALYSIS IN PYTHON

# Filters

Stephen Bailey  
Instructor

# Filters

Original

Smoothed

Sharpened

# Convolution with a sharpening filter

# Convolution with a sharpening filter

Sum

$$\begin{pmatrix} 1 * 0 & 1 * -1 & 1 * 0 \\ 1 * -1 & 2 * 5 & 1 * -1 \\ 1 * 0 & 1 * -1 & 1 * 0 \end{pmatrix} = \begin{pmatrix} 6 \end{pmatrix}$$

# Image convolution

```
import imageio
import scipy.ndimage as ndi

im=imageio.imread('foot-xray.jpg')

weights = [[.11, .11, .11],
            [.11, .12, .11],
            [.11, .11, .11]]

im_filt = ndi.convolve(im, weights)

fig, axes = plt.subplots(2, 1)
axes[0].imshow(im, cmap='gray')
axes[1].imshow(im_filt, cmap='gray')
plt.imshow()
```

# Filtering functions

scipy.ndimage.filters includes:

- median\_filter()
- uniform\_filter()
- maximum\_filter()
- percentile\_filter()

```
ndi.median_filter(im, size=10)
```

# Gaussian filtering

Gaussian distribution in 1 dimension

Gaussian distribution in 2 dimensions

```
ndi.gaussian_filter(im, sigma=5)
```

```
ndi.gaussian_filter(im, sigma=10)
```

**Let's practice!**

BIOMEDICAL IMAGE ANALYSIS IN PYTHON

# Feature Detection

Stephen Bailey  
Instructor

# Edges: sharp changes in intensity

Original

Kernel

?	?	?
?	?	?
?	?	?

\*

=

Edges

# Edge detection

```
im=imageio.imread('foot-xray.jpg')

weights = [[+1, +1, +1],
           [ 0,  0,  0],
           [-1, -1, -1]]

edges = ndi.convolve(im, weights)

plt.imshow(edges, cmap='seismic')
```

# Sobel filters

Sobel (H)

1	2	1
0	0	0
-1	-2	-1

Sobel (V)

1	0	-1
2	0	-2
1	0	-1

# Sobel filters

```
ndi.sobel(im, axis=0)
```

```
ndi.sobel(im, axis=1)
```

# Sobel filter magnitude

Combine horizontal and vertical edge data by calculating distance:

$$z = \sqrt{x^2 + y^2}$$

```
edges0=ndi.sobel(im, axis=0)
edges1=ndi.sobel(im, axis=1)

edges=np.sqrt(np.square(edges0) +
              np.square(edges1))
```

```
plt.imshow(edges, cmap='gray')
```
